

WEEK 1 PROJECT REPORT

SUPERSTORE SALES DATA IMPORT, POWER QUERY & DATA CLEANING

Project Title: Superstore Sales Data Analysis using Power BI

Tool Used: Microsoft Power BI Desktop

Dataset: Superstore Sales Dataset

INTRODUCTION

During Week 1 of this project, I worked with the **Superstore Sales dataset** using **Microsoft Power BI Desktop**. The main objective was to understand the process of importing raw data and preparing it for further analysis.

The dataset contains sales transaction information related to customers, products, categories, regions, sales, discounts, quantities, and profits. Since raw datasets may contain inconsistent formatting, incorrect data types, duplicate records, blank values, or unstructured information, data preprocessing was performed using the **Power Query Editor**.

The major activities completed during this week were:

- Importing the Superstore dataset into Power BI
- Inspecting the dataset in Power Query
- Checking and correcting data types
- Identifying missing values and duplicate records
- Cleaning and standardizing text fields
- Transforming categorical attributes
- Creating useful date-based columns
- Applying the transformations to the Power BI data model
- Verifying the cleaned dataset

The cleaned dataset prepared during this stage will serve as the foundation for visualization and business analysis in the upcoming weeks.

OBJECTIVES

The main objectives of Week 1 were:

1. To understand how to import a raw dataset into Power BI.
2. To explore the structure of the Superstore dataset.
3. To learn how to use the Power Query Editor.
4. To identify and handle data quality issues.

5. To ensure appropriate data types for different columns.
6. To clean and standardize categorical data.
7. To create useful date and time attributes.
8. To load the transformed data into Power BI.
9. To prepare a reliable dataset for future analysis and dashboard development.

STEP 1 – IMPORTING DATA INTO POWER BI

The first step was to import the Superstore dataset into Microsoft Power BI Desktop.

Home → Get Data → Text/CSV

Then, selected **Transform Data** so that the data could be inspected and cleaned using Power Query.

Power BI provides three major views:

- **Report View** – Used for creating charts, graphs, and dashboards.
- **Table View** – Used to inspect the actual rows and columns.
- **Model View** – Used to view tables and relationships.

This initial step helped me understand the structure and contents of the dataset before beginning the cleaning process.

STEP 2 – INSPECTING DATA IN POWER QUERY

After importing the dataset, I opened the **Power Query Editor** by selecting **Transform Data**. Power Query provides various tools for examining and transforming raw data. I inspected the columns and reviewed the information contained in each field.

The following aspects were checked:

- Column names
- Data types
- Missing or blank values
- Errors
- Duplicate records
- Text formatting
- Numerical values
- Date fields

I also enabled data-quality information where required to identify valid, empty, and error values.

This inspection helped determine which transformations were required before the dataset could be used for analysis.

STEP 3 – CHECKING AND CORRECTING DATA TYPES

Correct data types are essential for accurate analysis.

For example, a date column should be recognized as a **Date**, while numerical fields such as Sales and Profit should be recognized as numerical values. Incorrect data types can lead to problems when

performing calculations, filtering data or creating visualizations. Therefore, the data types were verified and corrected wherever necessary.

STEP 4 – CHECKING MISSING VALUES AND DUPLICATES

The dataset was examined for blank values and duplicate records.

Power Query's data-quality features were used to identify empty and error values. Important fields were checked carefully because missing information in important columns can affect the accuracy of analysis.

Duplicate records were also checked to ensure that the same transaction was not unintentionally repeated.

Where appropriate, duplicate records can be removed using:

Home → Remove Rows → Remove Duplicates

The purpose of this step was to improve data reliability and prevent duplicate transactions from affecting future calculations.

STEP 5 – CREATING YEAR COLUMN

The **Year** column was extracted from the Order Date column.

In Power Query, this was performed using:

Add Column → Date → Year → Year

The resulting column contains the year associated with each transaction.

STEP 6 – APPLYING THE TRANSFORMATIONS

After completing the required cleaning and transformations, the final dataset was reviewed in Power Query.

The following aspects were verified:

- Data types were correct.
- Text fields were standardized.
- Important categorical attributes were consistent.
- Date attributes were created.
- Unwanted errors were checked.
- Duplicate records were reviewed.

Once the dataset was ready, I selected:

Home → Close & Apply

Power BI then loaded the transformed dataset into the main Power BI environment.

STEP 7 – VERIFYING THE CLEAN DATA

After applying the transformations, I opened **Data View** in Power BI Desktop.

The newly created date columns were checked to confirm that they had been successfully added.

The final dataset was now structured and ready for further analysis.

= Table.AddColumn("#Reordered Columns", "Day", each Date.Day([Ship Date]), Int64.Type)						
Row ID	Order ID	Order Date	Ship Date	Ship Mode	Customer ID	Customer Name
Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%	Valid Error Empty 100%0%0%

DATA PREPROCESSING WORKFLOW

The complete Week 1 preprocessing workflow can be summarized as follows:

Raw Superstore Dataset

Import into Power BI

Open Power Query

Inspect Data

Check Data Types

Check Missing Values & Duplicates

Clean Text Fields

Standardize Categories

Create Date Attributes

Verify Transformations

Close & Apply

Final Clean Dataset

Ready for Analysis

KEY LEARNING OUTCOMES

Through this week's activity, I gained practical knowledge of the data preprocessing workflow in Power BI.

The major learning outcomes were:

- Understanding how to import external datasets into Power BI.
- Understanding the purpose of Power Query.
- Learning how to inspect raw data.
- Learning how to change column data types.
- Understanding the importance of data quality.
- Learning how to clean text values.
- Understanding categorical data standardization.
- Learning how to extract date-based attributes.
- Understanding basic Power Query M functions.
- Learning how to apply transformations and load the final dataset.
- Understanding how clean data provides a foundation for reliable business intelligence.

CONCLUSION

In Week 1, I successfully completed the initial data preparation stage of the Superstore Sales Analysis project using Microsoft Power BI.

The raw dataset was imported into Power BI and examined using Power Query Editor. Data types were verified, data quality was checked, text fields were cleaned, categorical attributes were standardized, and useful date-based columns were created.

The **Close & Apply** operation was then used to load the transformed dataset into Power BI. The final dataset was verified in Data View and Model View to ensure that the required transformations were successfully applied.

This activity demonstrated that **data preprocessing is a critical step in business intelligence and data analytics**. A properly cleaned and structured dataset improves the reliability of calculations, visualizations, and business insights.

The cleaned Superstore dataset is now ready for the next stages of the project, where it can be used to create visualizations, analyze sales and profit trends, identify customer and product patterns, and develop an interactive Power BI dashboard.
